Introduction

We hope you find this template useful! This one is set up to yield a 36x72" (3x6') horizontal poster when we print it at 200%.

We've put in the headings we usually see in these posters, you can copy and past a and change to your hearts content! We suggest you use large listed text against a light background so that it is easy to read Background color can be changed in format-background-edge of warm seem.

The boxes around the text will automatically fit the text you type, and if you click on the text, you can use the little handers that appear to stretch or superce the text boxes to whatever size you want. If you need just a fille more room for your type, go to format-line spacing and reduce it to 90 or even 85%.

The dotted lines through the center of the piece will not print, they are for alignment. You can move them around by dicking and holding them, and a little box will tell you where they are on the page. Use them to get your pictures or text boxes aligned together

How to bring things in from Excel® and Word®

Excel- select the churt, hit cell-copy, and then cell-paste into PowerFoint®. The chart can then be stretched to fit as required. If you need to cell parts of the chart, it can be ungrouped. Whether off or scientific symbols used in imported chart, which PowerFoi will not recorgain as used for at only again improperly if we'der have the foot intall edon our system. It is best to use the Symbol foot for scientific characters.

Words select the text to be brought into PowerPaint, bit edit-copy, then edit-paste the text into a new or existing text block. This text is editable. You can change the size, color, etc. in format-text. We suggest you not put shadows on smaller text. Stick with Anial and Timen-New Roman foots so your collaborates will have them.

We need images to be 72 to 100 dpi in their final size, or use a rule of thumb of 2 to 4 megabytes of uncompressed lif file per square foot of image. For instance, a 3x5 photo that will be 6x10 in size on the final poster should be scanned at 200 dpi.

We prefer that you import if or jpgimages into PowerPoint. Generally, if you double click on an image to open it in Microsoft Photo Editor, and it tells you the image is too large, then it is too large for PowerPoint to hande too. We find that images 12000 d00 girstes or smaller work very well. Very large images may show on your screen but PowerPoint cannot print them.

Preview: To see your in poster in actual size, go to view-zoom-100%. Posters to be reinted at 200% need to be viewed at 200%.

Feedback: If you have comments about how this template worked for you, email to sales@megarrint.com.

We listen! Call us at 800-590-7850 if we can help in any way.
